Angular CDK & Material

Alexander Thalhammer | @LX_T

Angular CDK

- Angular CDK includes the a11y package that provides tools to support various areas of accessibility
  - *LiveAnnouncer* is used to announce messages for screen-reader users using an aria-live region

```
this.liveAnnouncer.announce('Flights loading error');
```

  - *cdkTrapFocus* directive traps Tab focus in an element

```
<div class="gdpr-dialog" cdkTrapFocus>
  <!-- Yay, focus won't leave this element! -->
</div>
```

Demo

LiveAnnouncer Demo

Angular Material

– Angular Material library is a suite of reusable UI components that aims to be fully accessible

– If you're building your own Design System, you can copy what Angular Material is doing ☺

UI Components in NG

- Augmenting native elements
  - Native HTML elements capture several standard interaction patterns that are important to A11y
  - When authoring NG components, you should re-use native elements
  - Instead of creating a custom element for a new variety of button, create a component that uses an attribute selector with <button>
  - This most commonly applies to <button> and <a>, but can be used with many other elements
  - Example: MatButton
- Using containers for native elements
  - Sometimes using the appropriate native element requires a container element
  - E.g., the native <input> element cannot have children, so any custom text entry components need to wrap an <input> with extra elements
  - Example: MatFormField
